

RAT Screener

A Vermin Inspection Optimization Tool for
Washington, DC

Henry Feinstein, Kate Tanabe, and Shengao Yi
MUSA 801 Practicum

Our Client

Consults and provides government agencies with:

- Randomized evaluation
- Predictive modeling
- Resident-centered design
- Administrative data analysis

Team RATScreeener

- Henry Feinstein - App Development
- Kate Tanabe - Project Management
- Eric Yi - Modeling & Markdown

Use Case

Develop a vermin inspection optimization tool to increase efficiencies within the DC Health Department by **prioritizing inspection requests based on the likelihood of rat detection on a given block**

The Problem

Rodent infestations are costly to cities

- Sanitation problems
- Structural and property damage
- Power outages, internet blackouts, and electrical fires
- Public health risks

**In 2021, DC's 311 Service
received over 12,000
requests for rodent
inspection...**

**DC has 8 vermin
inspectors**

Business as usual approach:

- Limited number of inspectors
- Relies on professional knowledge and ad hoc decision-making
- No formal inspection prioritization
- Outdated processes

46%

Percent of DC 311 Requests for rodent inspection that actually detect rat activity

The Solution

RAT Screener

Rodent Algorithmically
Targeted Screener

- Predictive model and web app
- Estimates the probability of rat detection in a given area based on spatial, historic, and built environment data
- Allows for more targeted and efficient inspections

RATScener

RAT Screener Overview

Unit of analysis

Data

11,000 requests for rodent inspections from 2015 to 2018

100 field validation test points

Externally collected data

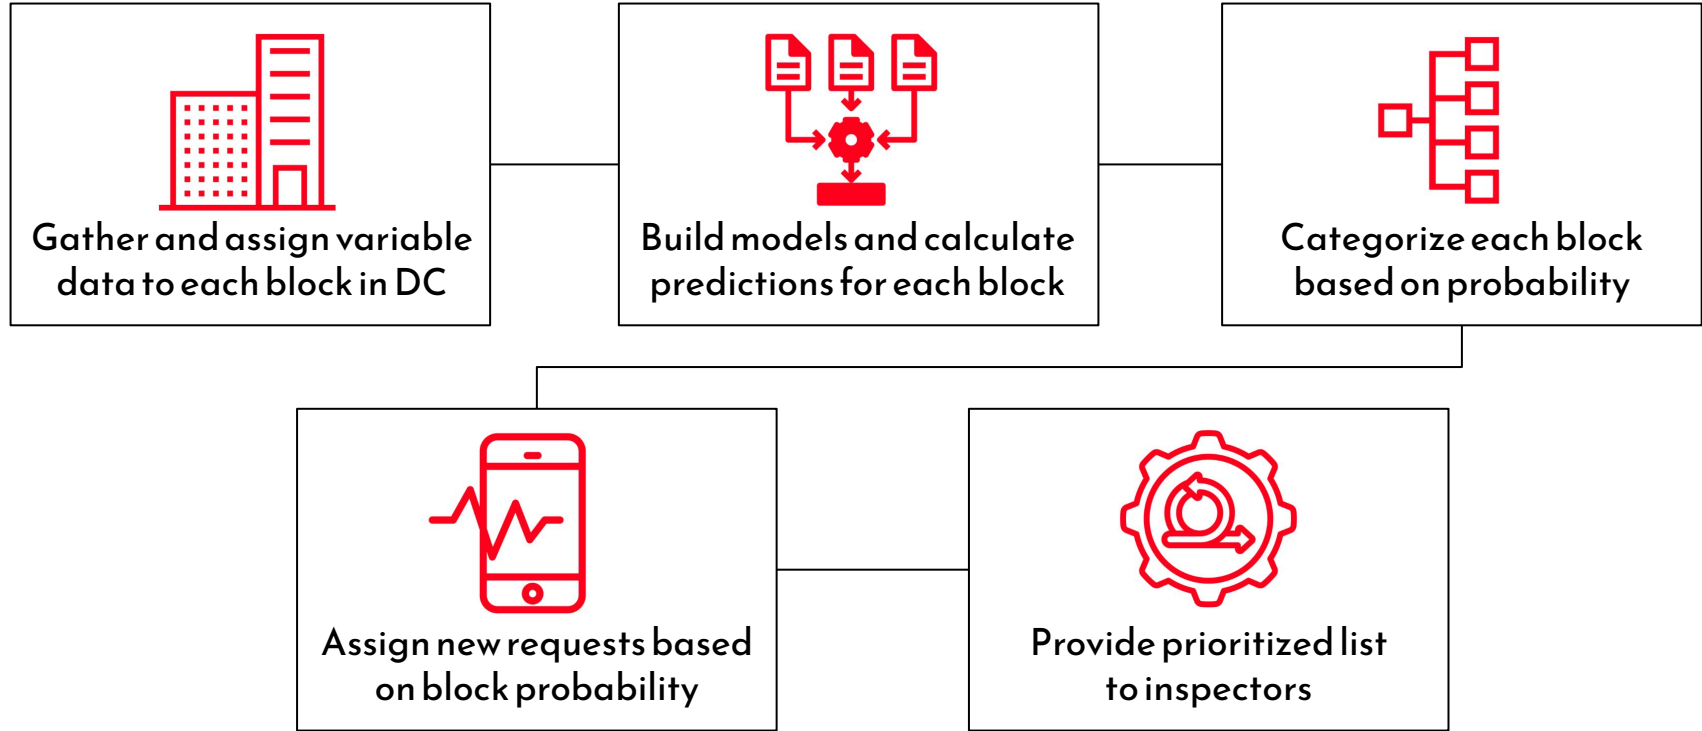

Result

Enhance DC's municipal rodent management program

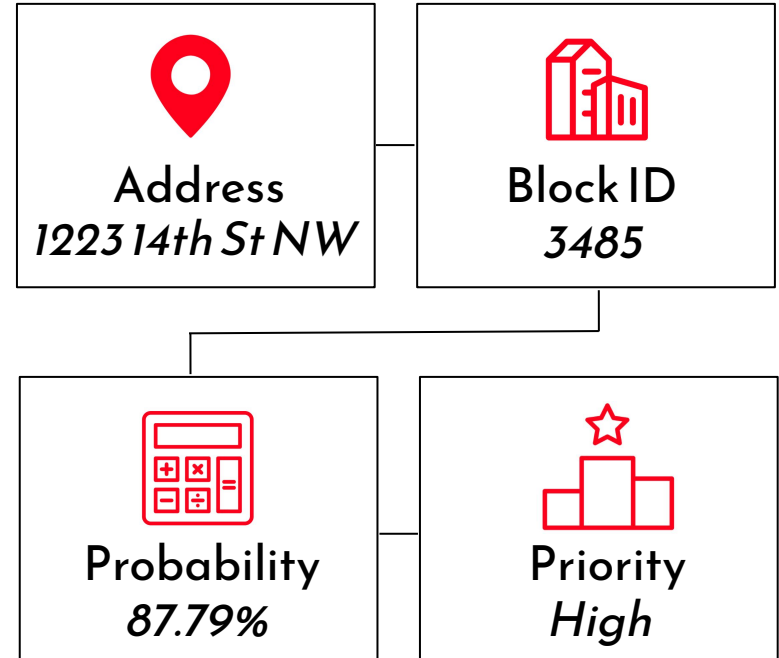

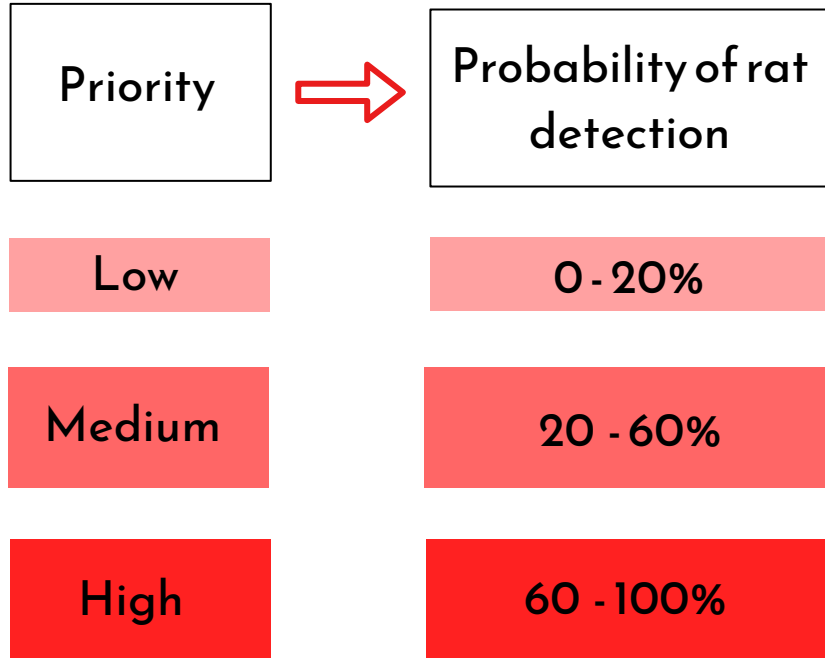

Help inspectors prioritize requests

Save money, time, and resources

RAT Screener Process

RAT Screener Outcomes

Exploratory Analysis

RATScreeener

Rat Inspection Requests

2015 - 2018

Population Density By Block

People per square foot

Distance to Hotspot by Block

Feet, Hotspot p-value = 0.001

Feature Selection

RAT Screener Features

Spatial

- Nearest instances of rat detection
- Distance to rat detection hotspots

Historic

- Rats detection history
- Infrastructure issue requests
- Missed trash pick up requests
- Construction permits

Built Environment

- Storm drains
- Sewer grates
- Trash cans
- Impervious surfaces
- Zoning
- Residents per unit

Climate

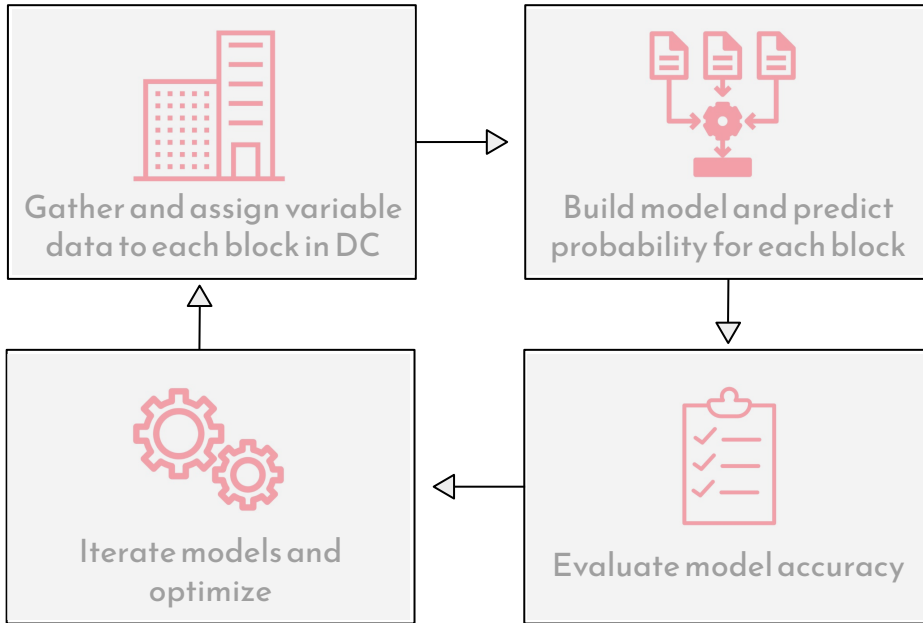

- Temperature
- Season
- Wind

Modeling

RAT Screener Models

Modeling Process

Accuracy:

$$\frac{\text{Correctly predicted blocks}}{\text{Total blocks}} = \%$$

RAT Screener Models

Modeling Process

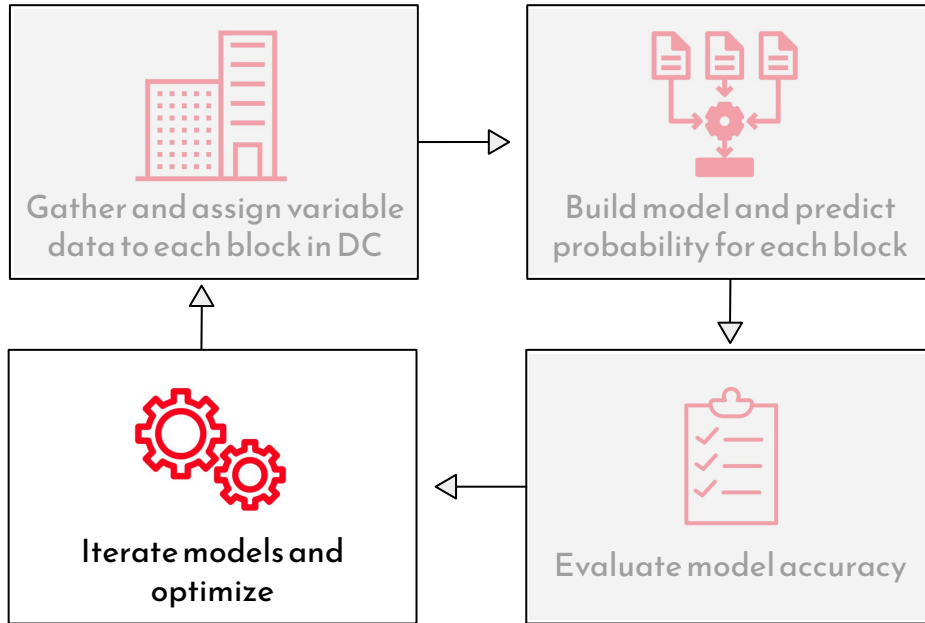

Optimization:

- Conduct cost-benefit framework
- Identify optimal threshold (rat detection probability %)
- Apply threshold and improve model performance

RAT Screener Models

Modeling Process

Cost-benefit Framework:

Accurate rat detection

Inaccurate rat detection

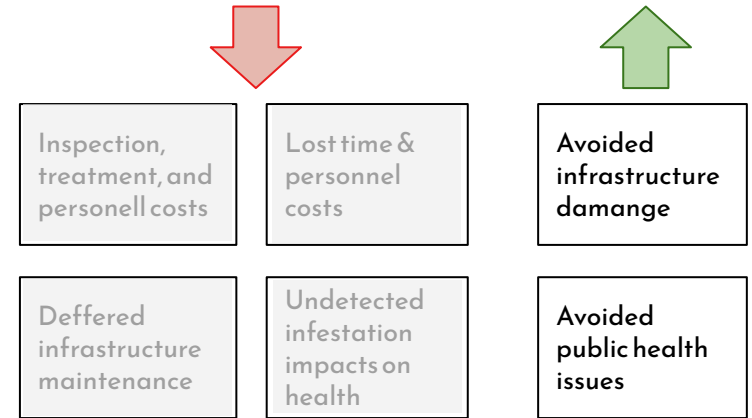

RAT Screener Models

Modeling Process

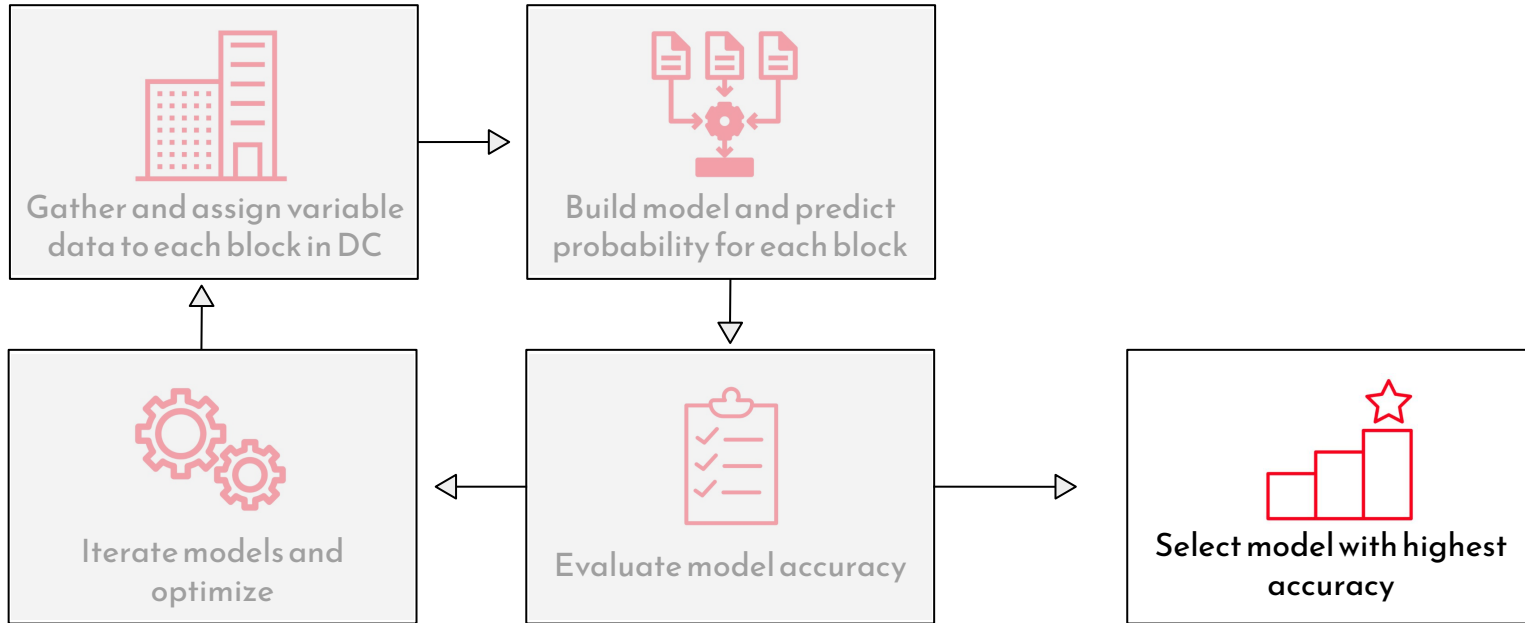

Optimal Threshold: **20%**

RAT Screener App

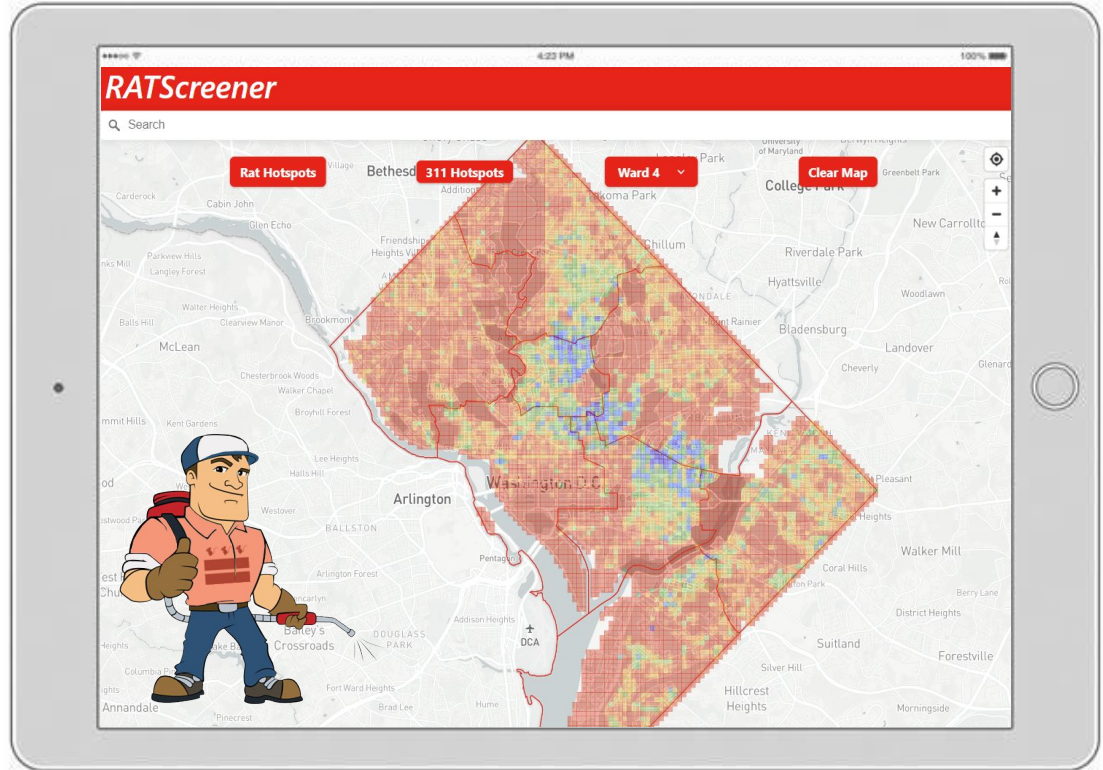

RAT Screener App

Designed for DC vermin inspectors to use while in the field and on inspection visits

Uses:

- View prioritized inspection requests and locations
- Review notes from prior inspections
- Visualize rat detection and 311 request hotspots

<https://henryfeinstein.github.io/musa-rats/site/>

Conclusion

RAT Screener

- Rodent infestations and rodent management programs are huge costs to cities
- Inspectors are knowledgeable assets to any local government
- Incorporate spatial data to improve model performance and increase efficiencies within inspection system

Thank you!
